# Improving Fairness via Federated Learning

Yuchen Zeng, Hongxu Chen, Kangwook Lee

University of Wisconsin-Madison

#### **1. Background**

#### Fairness

Train a classifier that is fair to different

#### $\left\langle \mathbb{P}(\hat{\mathbf{y}}=1 \mid \mathbf{a}=0) - \mathbb{P}(\hat{\mathbf{y}}=1 \mid \mathbf{a}=1) \right| \downarrow \right\rangle$ $\mathbb{P}(\hat{y} = 1 \mid a = 0) < \mathbb{P}(\hat{y} = 1 \mid a = 1)$ **Prior Offenses** Prior Offenses 2 armed robberies, 4 juvenile Server $w^{(2)}$ $w^{(3)}$ **w**<sup>(1)</sup> 1 attempted armed Misdemeanors Update $\lambda$ based on the losses .... robbery Private Server collects local group-Private Private HIGH RISK LOW RISK data data

 $w^{(1)} + w^{(2)} + w^{(3)}$ 

Global model

#### 4. Our proposed algorithm: FedFB

#### Fairness notion (demographic parity)

- *a*: sensitive attribute
- y: label
- $\mathbb{P}(\hat{y} = 1 \mid a = 0) = \mathbb{P}(\hat{y} = 1 \mid a = 1)$

#### Mitigate bias with reweighting mechanism

the orchestration of a central server, while

#### 2. Overview

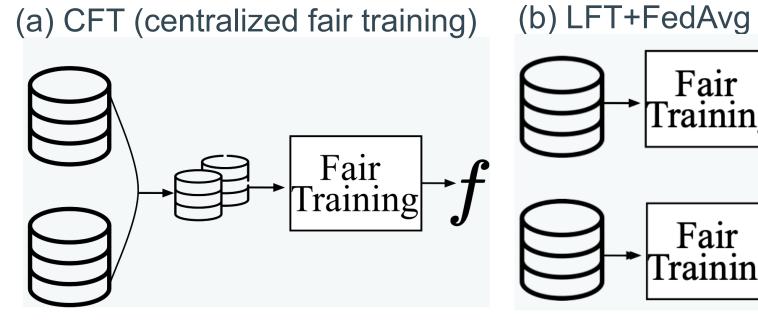

#### Key challenge

How to learn fair classifiers from decentralized data, without compromising much privacy?

## Takeaways

- Federated learning is necessary for model fairness.
- We can obtain better fairness-accuracy tradeoff with our proposed algorithm FedFB, which exchanges a few bits more information per communication round.

#### **Baselines**

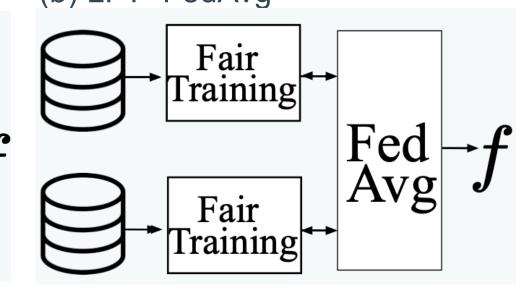

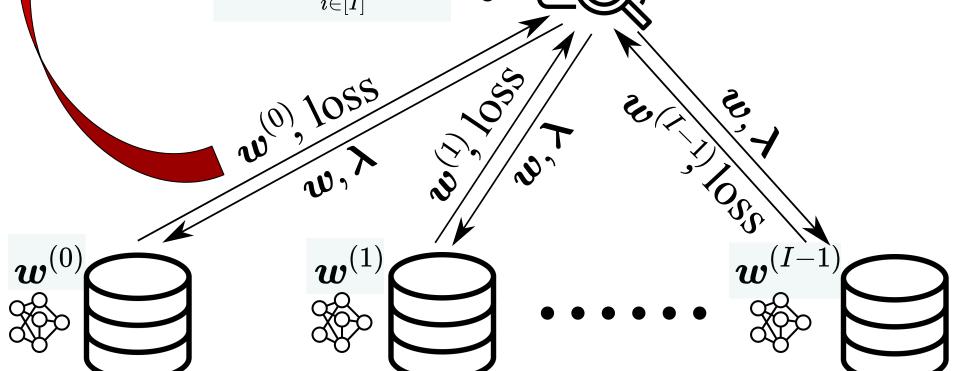

Fig 3. High-level illustration and summary of the baselines.

#### 3. Theory results

#### Federated Learning boosts model fairness.

specific losses sent from clients to estimate this condition

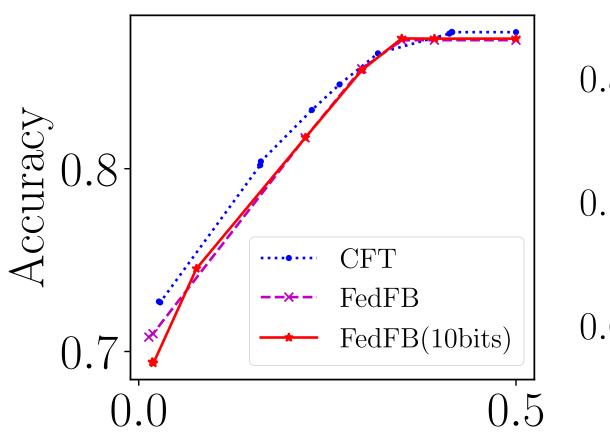

- λ: sample weights
- w: model parameters

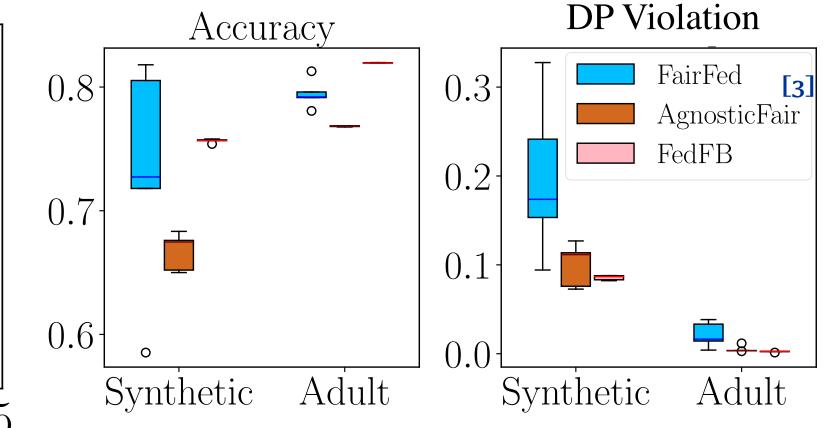

## **5. Experiments**

# Demographic Parity (DP)

The performance of our FedFB and its private variant nearly matches the performance of CFT.

#### **DP** Violation Fig 5. Accuracy-fairness tradeoff

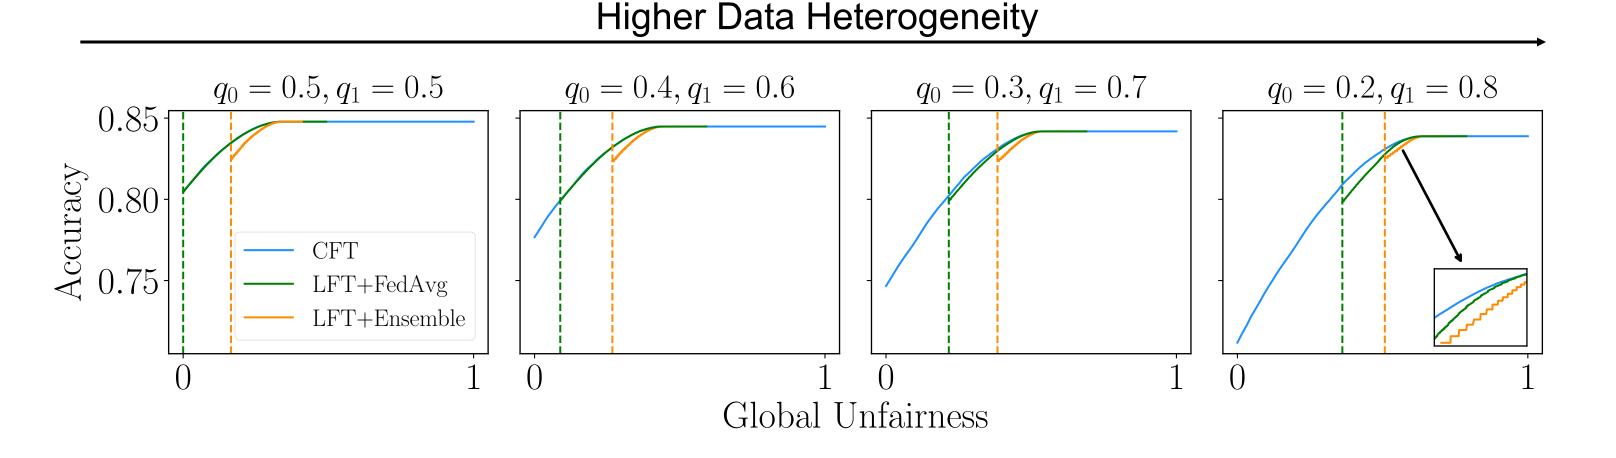

Fig 6. Performance comparison in terms of accuracy of fairness violation on logistic regression.

Theorem (informal): under certain conditions, *inf Unfairness*(LFT + Ensemble) > inf Unfairnes(LFT + FedAvg).

### LFT+FedAvg is not sufficient.

Lemma (informal): under certain conditions, *inf* Unfairnes(CFT) < *inf* Unfairness(LFT) + FedAvg).

#### Numerical Results

#### Conclusions

Fairness: LFT+Ensemble < LFT+FedAvg < CFT</li>

curves on the synthetic dataset.

#### Client Parity (CP)

<u>Client parity</u> is a specific fairness notion for federated learning, which requires the loss of different clients to be equal.

Even though our FedFB is not designed for client parity, it closely matches the performance of the state-of-the-art fair federated learning algorithms designed for client parity.
